Product narrative

6SNT.ADIF-HUB is a local hub for operators who accumulate logs in several formats and need to clean them before uploading to their main platforms.

Problem

QSOs get scattered across ADIF exports, Excel sheets, CSV files, Cabrillo contest logs and personal tools. The operator ends up with duplicates, incomplete fields and fear of polluting LoTW, eQSL, ClubLog or the primary logger.

Promise

Clean and consolidate before uploading.

What it is

- Local hub for ingest, normalization, deduplication, conflict resolution and ADIF export.
- Preparation and review tool.
- Intermediate layer between scattered files and external platforms.

What it is not

- Not a live logger.
- Not a replacement for LoTW, eQSL, ClubLog, QRZ, Log4OM, N1MM or DXKeeper.
- Does not automate external uploads.
- Does not promise full compatibility with every historical format.

Pillars

- Local-first.
- Privacy.
- Multiformat ingest.
- ADIF 3.1.7.
- Intelligent deduplication.
- Human control.
- Clean export.

Prelaunch FAQ

Is it a logger?

No. It is a log preparation tool.

Does it replace LoTW/eQSL/ClubLog?

No. It helps prepare an ADIF before using those platforms.

Does it upload data to the internet?

Not in the current design. Processing is local.

Can I use my real log?

Only with backup. During beta, test first with copies and subsets.

Which formats are supported?

ADI , ADX , Cabrillo , CSV , TSV , XLSX and JSON , with documented limitations.

Is deduplication automatic?

It detects candidates and offers resolution, but the operator must review important conflicts.

What about sensitive data?

Do not upload it to the repo or share it in screenshots. Use sanitized data for bug reports.

Community distribution strategy

Principle

No dedicated website at first. GitHub acts as the technical source of truth: releases, changelog, issues and documentation. Communities are used to learn, validate and request feedback, not to push sales.

Channels

- Ham radio forums.
- Reddit.
- QRZ.
- eHam.
- Facebook groups.
- Local clubs.
- POTA/SOTA communities.
- Contest communities.

Rhythm

Post sparingly, with context and value. Alternate education, discovery, closed beta and demos. Do not copy the same text into every channel.

Recommended CTA

Ask for technical feedback and sanitized test cases. Avoid commercial links or sales messages in the first interaction.

Matriz de canales

Canal	Audiencia	Riesgo autopromocion	Tono	Frecuencia	Contenido permitido	CTA
GitHub	Tecnicos y beta testers	Bajo	Preciso	Por release	Releases, docs, issues	Probar y reportar
Reddit	Operadores mixtos	Alto	Conversacional	Bajo	Preguntas, demos tecnicas	Pedir experiencias
QRZ	Radioaficionados generales	Medio	Respetuoso	Bajo	Beta y explicacion clara	Feedback
eHam	Usuarios de software ham	Medio	Tecnico	Bajo	Review de herramienta	Casos de prueba
Facebook	Grupos amplios	Alto	Breve	Muy bajo	Capturas saneadas, pregunta	Comentarios
Clubes	Operadores locales	Bajo	Practico	Por evento	Demo, taller	Beta cerrada
POTA/SOTA	Activadores	Medio	Caso de uso	Bajo	CSV/Excel, referencias	Probar flujo
Contest	Contesters	Medio	Tecnico	Bajo	Cabrillo, duplicados	Probar concursos

60-day content calendar

Week 1-2

- Prepare internal release.
- Review ES/EN docs.
- Create screenshots with sanitized data.
- Ask a discovery question in a trusted channel, without commercial link.

Week 3-4

- Invite a small closed beta group.
- Share a short technical demo of ingest and mapper.
- Collect errors through the matrix.

Week 5-6

- Publish a learning post about Cabrillo or Excel/CSV.
- Share beta notes without private data.
- Expand beta only if there are no blockers.

Week 7-8

- Prepare release notes.
- Post a broader beta invitation in 1 or 2 communities.
- Answer questions with clear limitations.

Rule

Do not post every day. Separate ES/EN messages and adapt tone to each community.

Post templates EN

Discovery

I am working on a local tool to clean and consolidate ham radio logs before uploading to platforms like LoTW/eQSL/ClubLog. Which format causes you the most trouble today: ADIF, Cabrillo, CSV, Excel or something else?

ADIF explanation

ADIF is a strong interchange format, but many problems happen before export: incomplete columns, duplicates, time differences and mixed sources. I am testing a local review flow before upload.

Cabrillo

Cabrillo logs are great for contests, but reusing them as general logs can be hard because exchanges vary by contest. I am validating a local mapper to ADIF with manual review.

Excel/CSV

Many operators keep historical QSOs in Excel or CSV. The hard part is not opening the file, but mapping columns and avoiding duplicates before exporting ADIF.

Closed beta invite

I am looking for a small number of operators for a closed beta of a local ADIF cleanup app. I do not need public real logs: feedback is enough, and if there is a bug, a minimal sanitized case helps.

Deduplication demo

Technical demo: import, normalize, detect likely duplicates and resolve conflicts before exporting `ADI`. The goal is not blind automation, but operator control.

Release notes

New beta build: improvements in formats, mapper, deduplication and documentation. Known limitations are documented. Technical feedback welcome.

Reglas de publicacion

- Leer reglas de cada comunidad antes de publicar.
- Participar antes de promocionar.
- No repetir el mismo post en todos los canales.
- Declarar autoria.
- Pedir feedback antes que venta.
- No publicar enlaces comerciales en primera interaccion.
- No automatizar spam.
- No publicar capturas con datos reales.
- No prometer compatibilidad total.
- Responder criticas con evidencia tecnica y limites claros.

Checklist pre-publicacion

- Idioma correcto.
- Canal correcto.
- Tono no vendedor.
- Reglas de comunidad revisadas.
- Captura sin datos reales.
- Link correcto.
- Version correcta.
- Limitaciones declaradas.
- CTA claro.
- No hay promesa de subida automatica externa.
- No hay datos privados en texto, imagenes o archivos adjuntos.
